

Be Active

Overview

Finding time in our overscheduled lives for physical activity is a challenge for all busy Americans. But anyone who has successfully managed to do so will tell you how much more energy they have, and how they are actually able to do more than before they started getting regular exercise. So no more excuses! Make it your mission to fight heart disease by being active.

Why be physically active?

The facts are clear: By getting at least 150 minutes of moderate physical activity each week you can reduce your risk of heart disease. Without regular physical activity, the body slowly loses its strength and ability to function well.

Being active is as important as reducing calories in helping you lose weight! And it's good for your heart, lungs, bones, muscles and mind. Regular physical activity helps lower your risk of heart attack, stroke, high blood pressure and other health problems. Ask your doctor or health professional for a physical activity plan that's right for you.

Tips to help you be active

- Schedule time in your day for physical activity. Make a date to walk during your lunch time at work, or go for a walk with your friends or family in the evening.
- Substitute physical activity where possible. Choose a parking spot that allows you to get a few extra minutes of walking, or take the stairs instead of the elevator. Every little bit helps!
- Pick active outings. Instead of going to the movies, visit a zoo or museum where you can walk around while being entertained.
